Target version:				

Description

Description (of abcd2:Identification-DayNumberBegin): *The Julian day number (or sequential day) in the year for the exact date or for the beginning day of a period representing the unit identification event. The year is given in ISO-Date-Time-Begin. The content range is 1-365 for normal years, 366 for leap years.*

Note that this element is not normally used for identifications.

The elements are not used and this kind of information is presumably not stored in any database. If there are no unexpected use cases, the coresponding elements can be removed in ABCD (6 in total) and EFG (38 in total)

History

#1 - 01/23/2017 01:22 PM - D. Fichtmüller

- Project changed from ABCD 3.0 Project to ABCD

- Subject changed from Julian Day Number to remove DayNumberBegin & DayNumberEnd elements

- Description updated

- Category set to Simplification
